

**Go**  
Go Cam

# For the adventure seekers

**The perfect tool for capturing the moment to moment thrills...**

Adventure seekers seek the element of risk, so let us help you stay safe in the process. To help keep the adventure seeker safe, *Han and Han* has developed a photographic device that set entirely new standards for an efficient photographic process, where hands might not be available to take a photo. Used by hundreds in the travelers world wide, taking part in outdoor activities like biking, skiing, skating, boarding, rock climbing, white water rafting and more.

Introducing Go Cam, glasses with a built in camera, allowing for a risk free

photo capture while mid adventure. By incorporating concepts of microphotography, Go Cam utilizes a retrievable memory chip located in the hinges of the glasses, which is used to keep a record of photos. The camera is small: approximately the size of a hex nut. Inside the hex nut is a photocell that adjusts exposure for a wide range of illumination. In the temple of the glasses is a photo button. A quick push of the button takes the photo, and without a sound, a photo record has been made. A white light indicates whether the photo was successfully taken. The photo can be viewed in myriad of ways: digitally, projected, printed, to name a few.
